- Some general features
- Different X-ray techniques employed
- Self-assembly & complexity
- Out-of-equilibrium phenomena
- Summary and outlook

What is Soft Matter?

Soft matter is a subfield of condensed matter physics (CMP) comprising a variety of physical states that are easily deformed by thermal stresses or thermal fluctuations. They include liquids, colloids, polymers, foams, gels, granular materials, and a number of biological materials. These materials share an important common feature in that predominant physical behaviors occur at an energy scale comparable with room temperature thermal energy. At these temperatures, quantum aspects are generally unimportant. Pierre-Gilles de Gennes, who has been called the "founding father of soft matter,“ received the Nobel Prize in physics in 1991 for discovering that the order parameter from simple thermodynamic systems can be applied to the more complex cases found in soft matter, in particular, to the behaviors of liquid crystals and polymers.

Matière molle » Madeleine Veyssié

Today soft matter science is an interdisciplinary field of research where traditional borders between physics and its neighboring sciences such as chemistry, biology, chemical engineering and materials science have disappeared. It is one of the frontiers of CMP along with strongly correlated electron systems and nanoscience.

Soft Matter: Encounter in everyday life

Sustainable development through more rational design of consumer products

Soft Matter: COVID-19

COVID-19 pandemic exposed the knowledge-gap

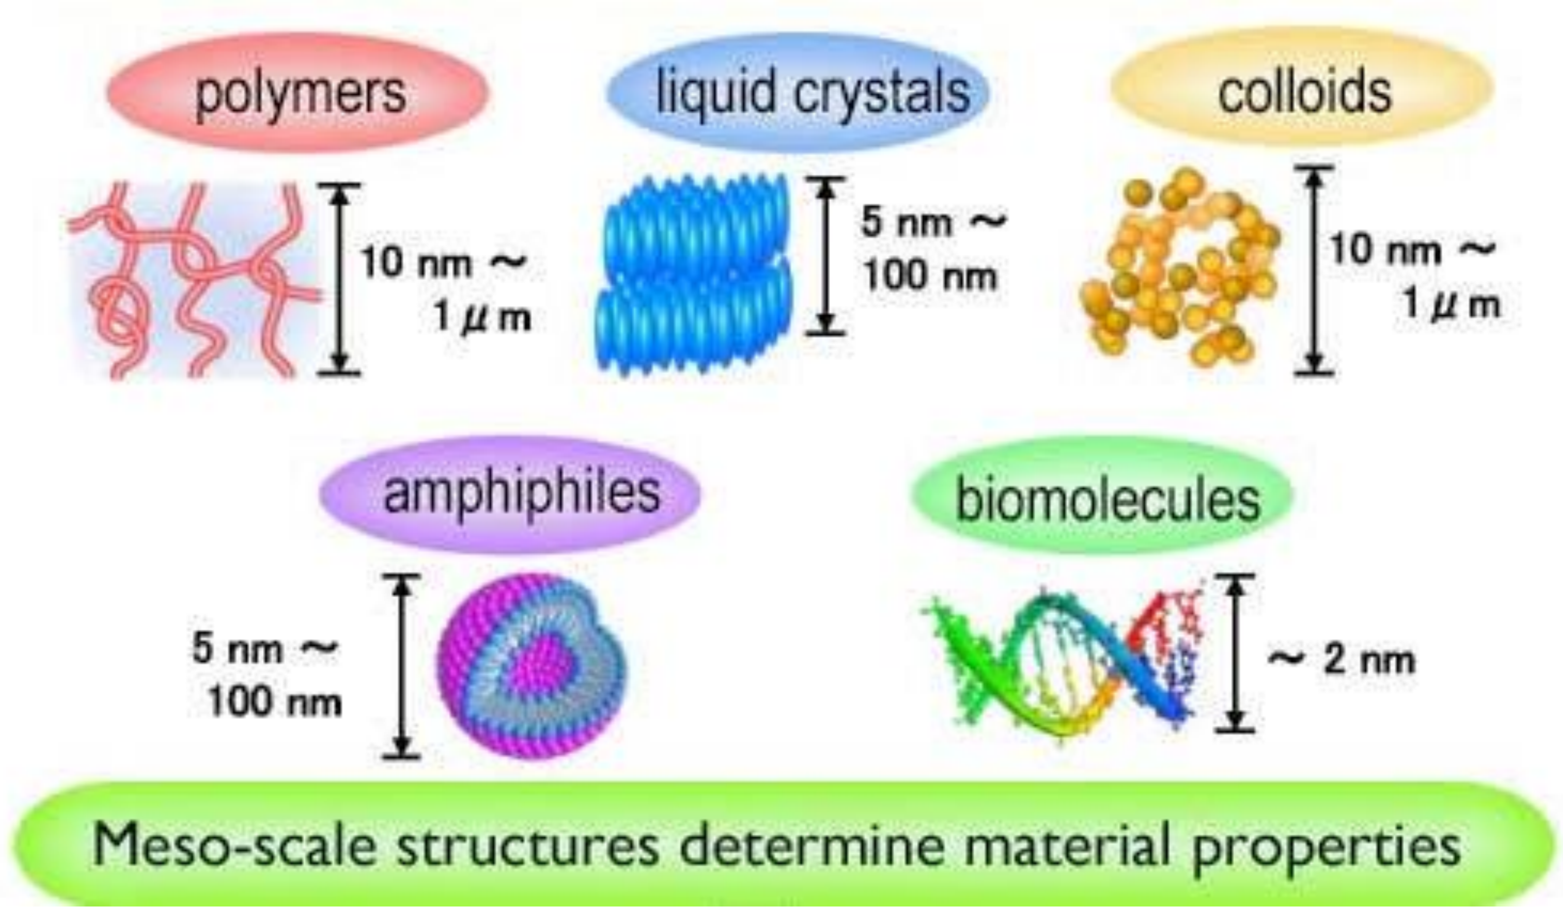
Soft Matter Systems



SAXS, WAXS, USAXS, GISAXS
(SANS, USANS, GISANS, etc.)

Soft Matter Features

Materials which are soft to touch – characterized by a small elastic modulus (energy/characteristic volume), typically $10^9 - 10^{12}$ times lower than an atomic solid like aluminum.

Dominance of entropy

Strong influence of thermal fluctuations (~ $k_B T$)

Characteristic size scale or microstructure ~ 100 – 1000 nm

Shear modulus, G ~ Energy/Free volume » $10^9 - 10^{12}$ smaller

Low shear modulus (G) » soft and viscoelastic

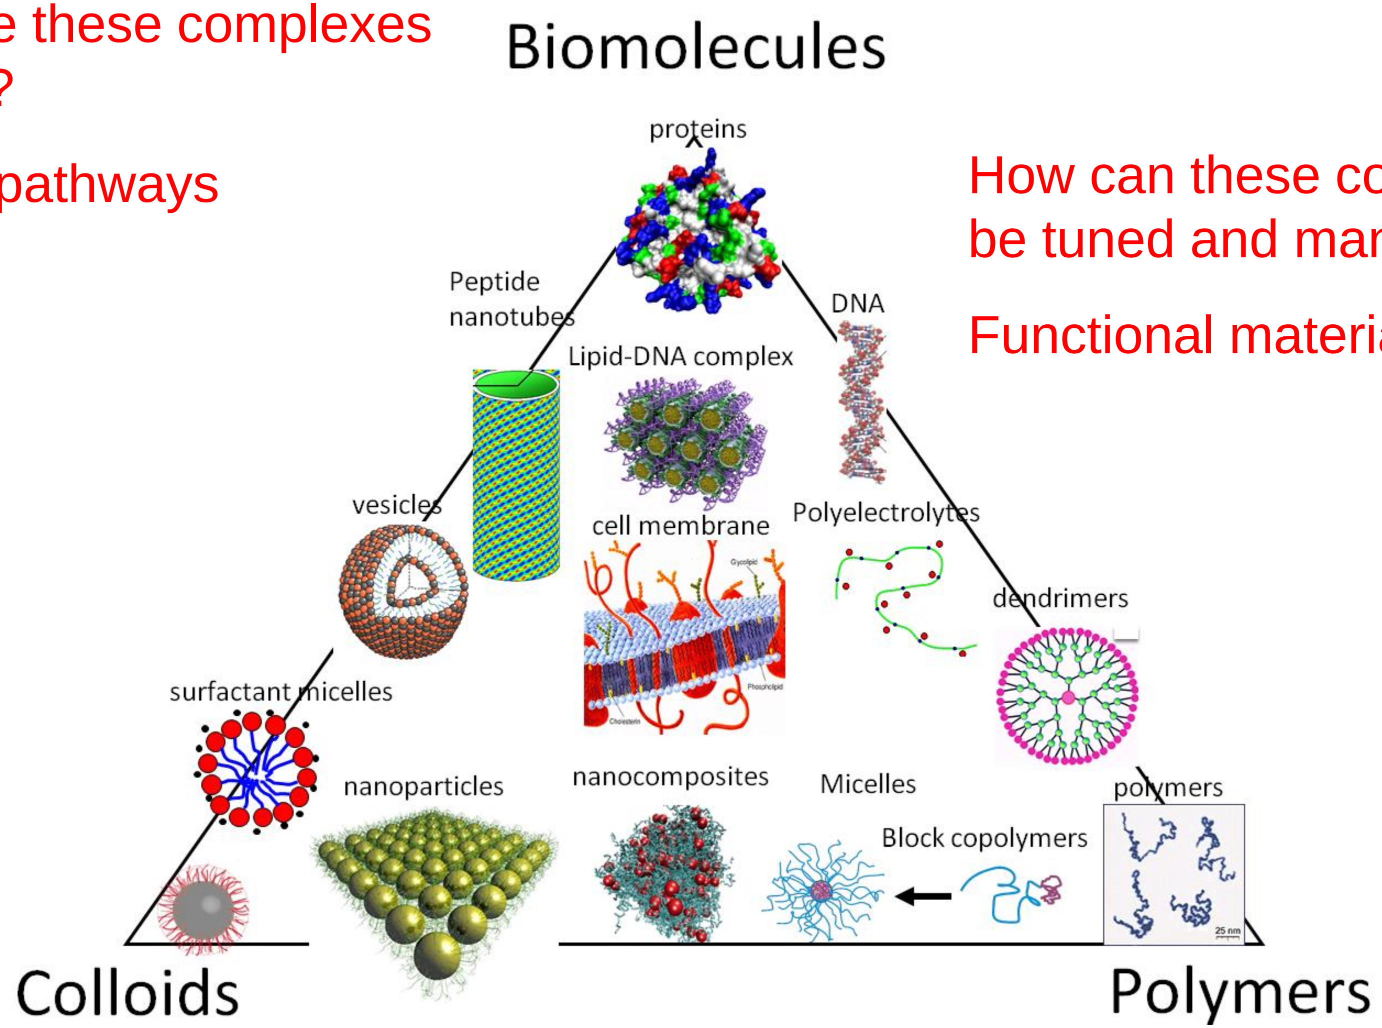
Soft Matter studies seek to address the link between microscopic structure/interactions and macroscopic properties.

Soft Matter constitutes a significant fraction of modern day Nanoscience/Nanotechnology.

Self-Assembled Soft Matter Systems

How are these complexes formed?

Kinetic pathways



How can these complexes be tuned and manipulated?

Functional materials

Synchrotron Techniques used in Soft Matter

Synchrotron Radiation Studies of Soft Matter

• ***High spectral brilliance or brightness***

Real time studies in the millisecond range, micro/nano focusing and high *q* resolution

Time-resolved SAXS, WAXS, micro-SAXS, USAXS, etc.

• ***Partial coherence***

Equilibrium dynamics using the coherent photon flux (for concentrated systems)

Photon correlation spectroscopy (XPCS)

• ***Continuous variation of incident energy***

Contrast variation of certain heavier elements, e.g. Fe, Cu, Se, Br, Rb, Sr, etc.

Anomalous Scattering – contrast variation

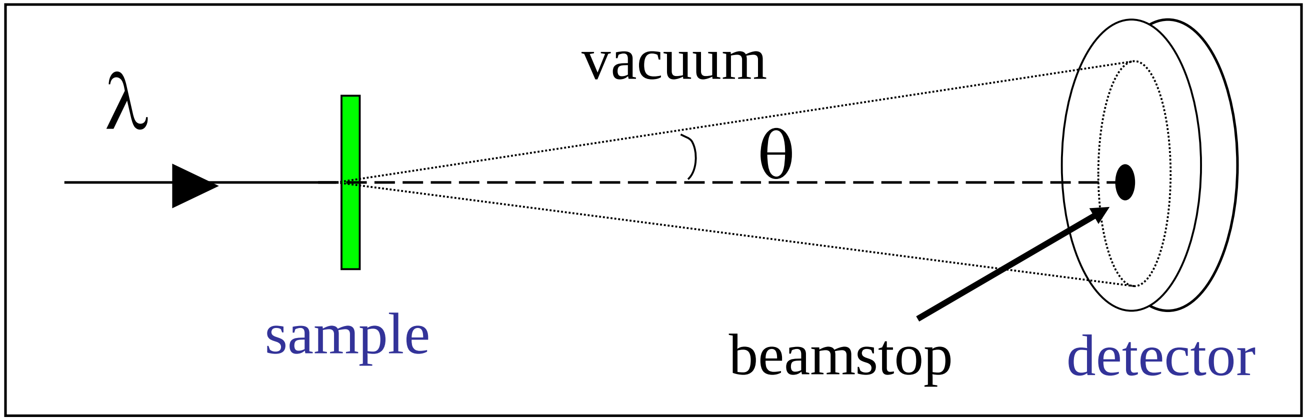
• ***Complementary imaging techniques***

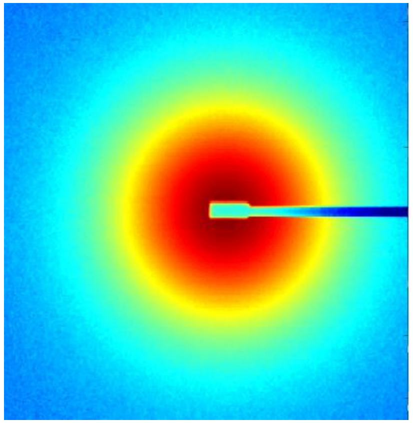
X-ray microscopy, micro and nano tomography, etc.

Radiation damage

Small-Angle X-ray Scattering (SAXS)

Scattering originates from the spatial fluctuations of electron density





$$q = \frac{4\pi}{\lambda} \sin(\theta / 2)$$

Measured Intensity: $I_S = i_0 \, T_r \, \varepsilon \, \Delta\Omega \frac{d\sigma}{d\Omega}$

Differential scattering cross-section

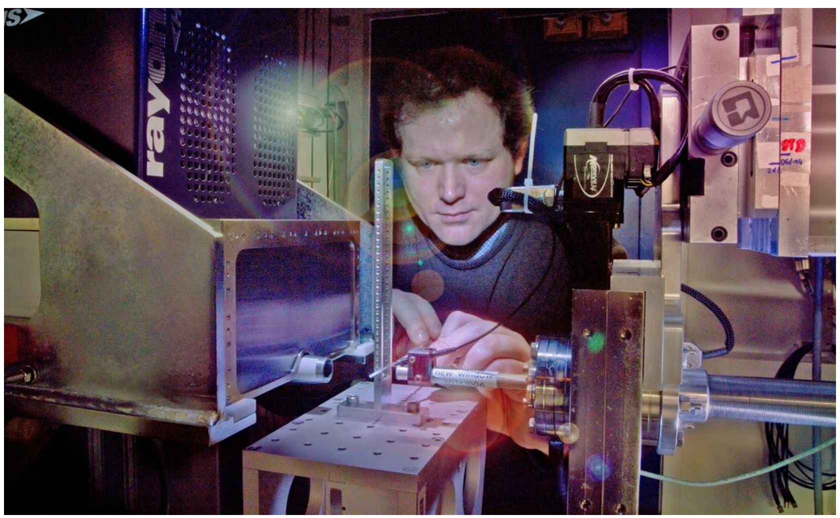
i_0 - incident flux
T_r - transmission
ε - efficiency
$\Delta\Omega$ - solid angle

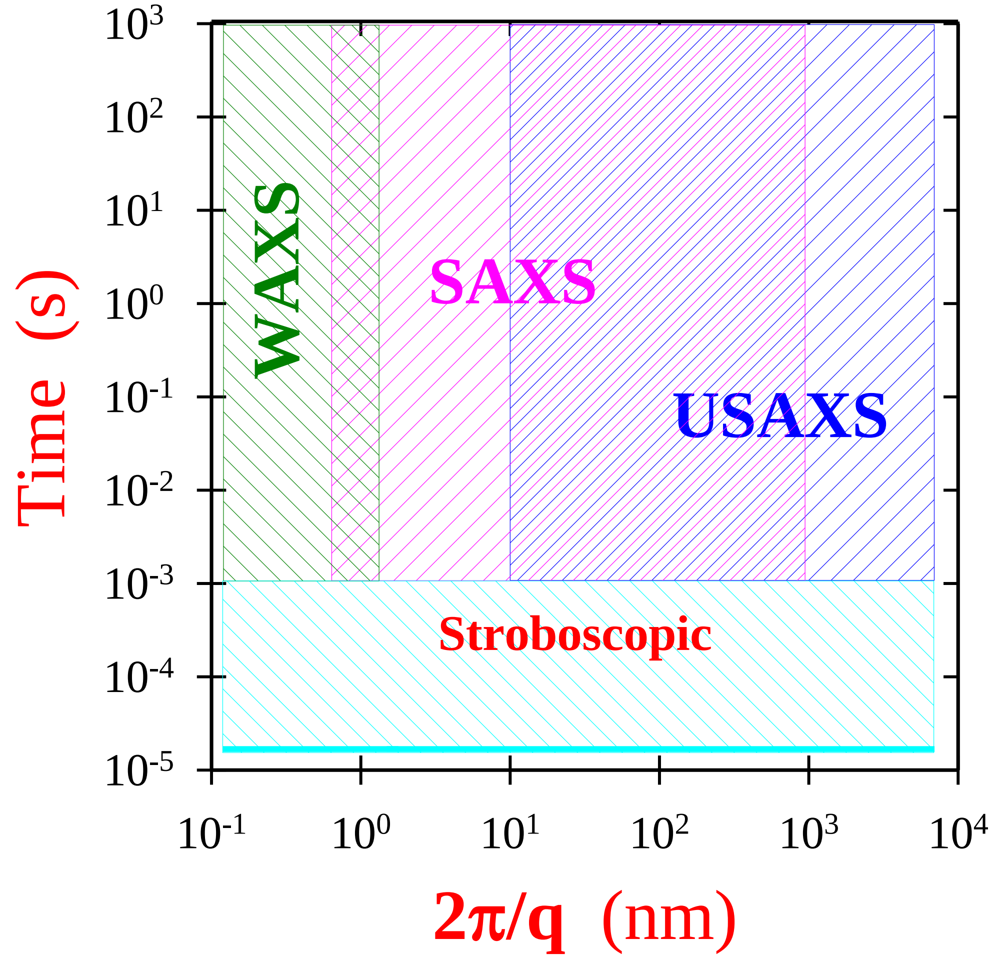
$$I(q) = \frac{d\Sigma}{d\Omega} = \frac{1}{V_{Scat}} \frac{d\sigma}{d\Omega}$$

Beamline – ID02

Ultra SAXS/SAXS/WAXS

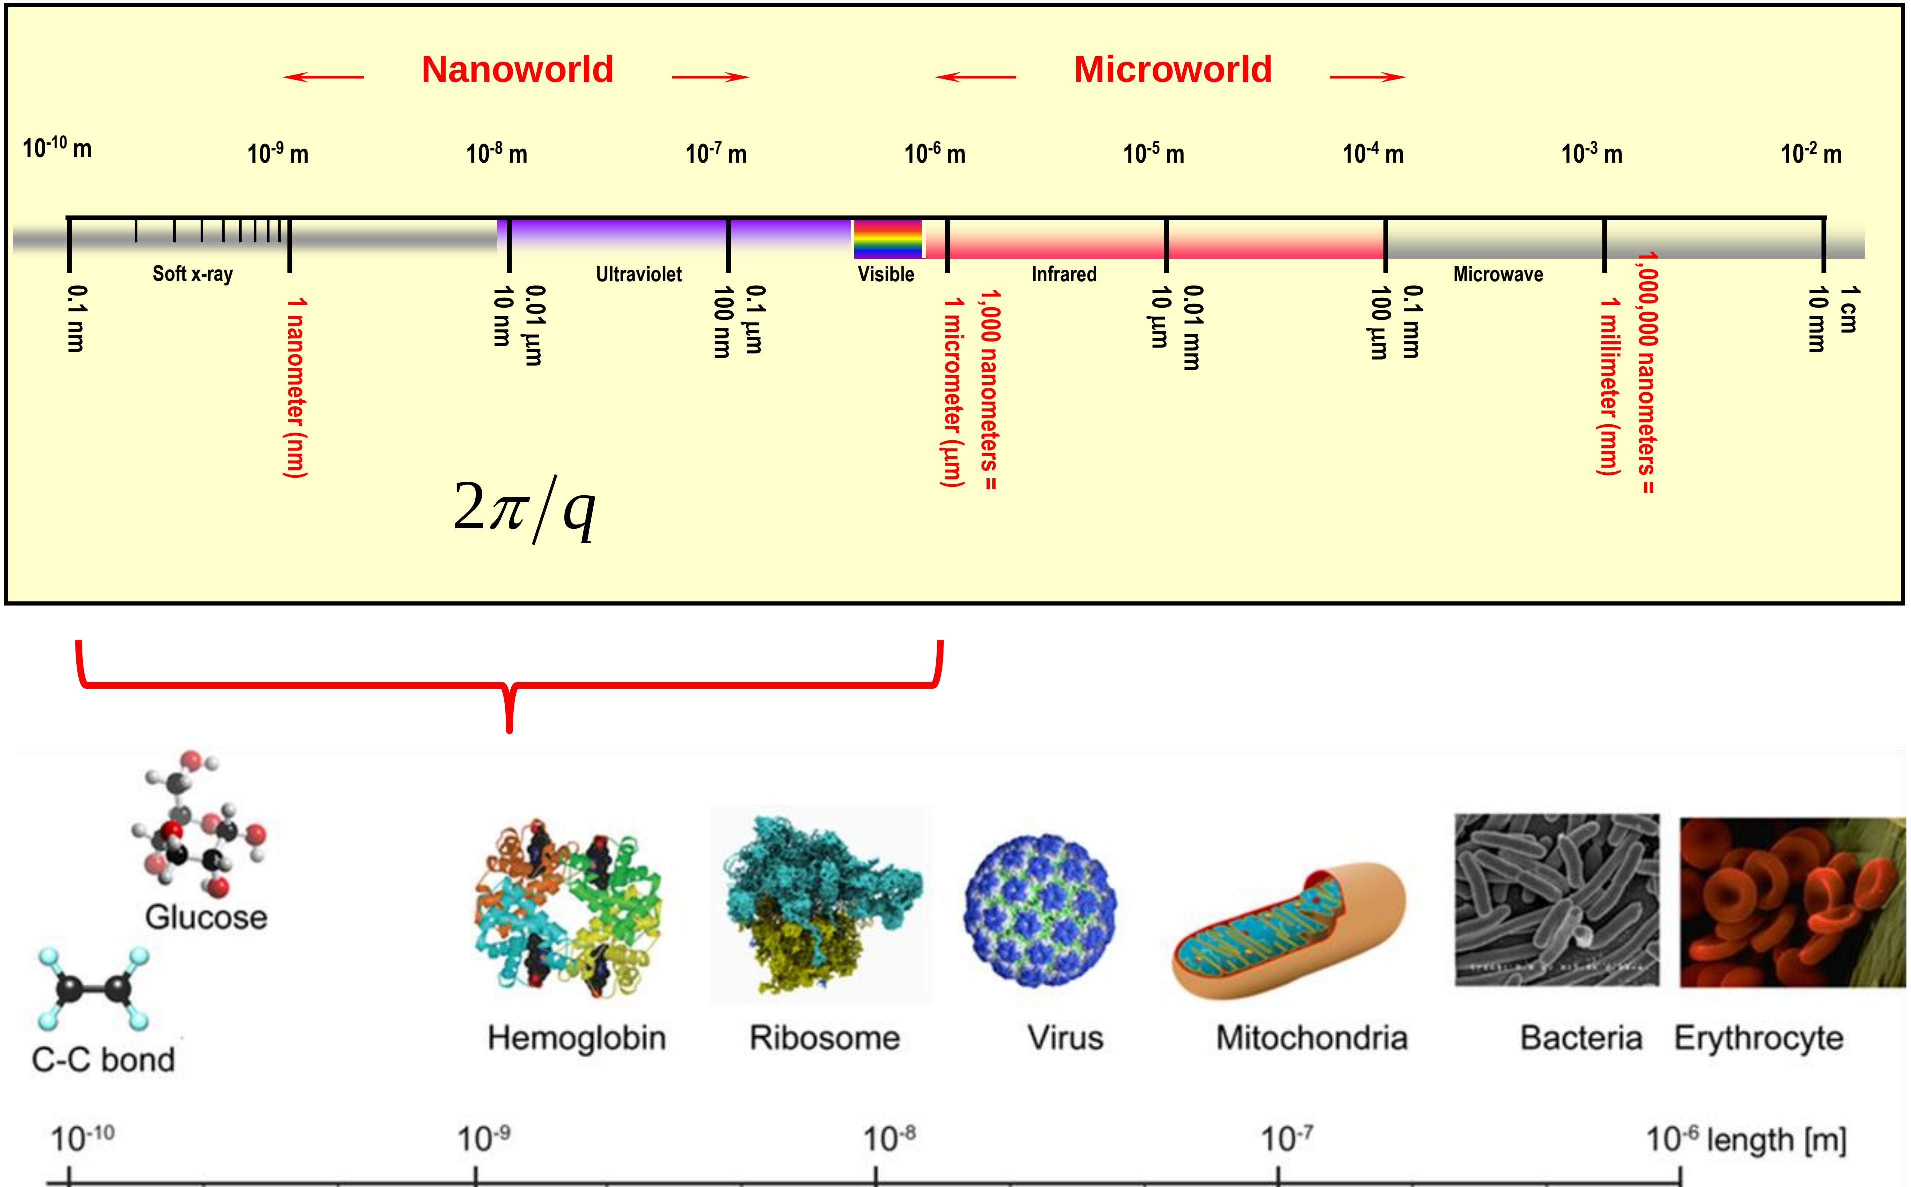
Beamline ID02



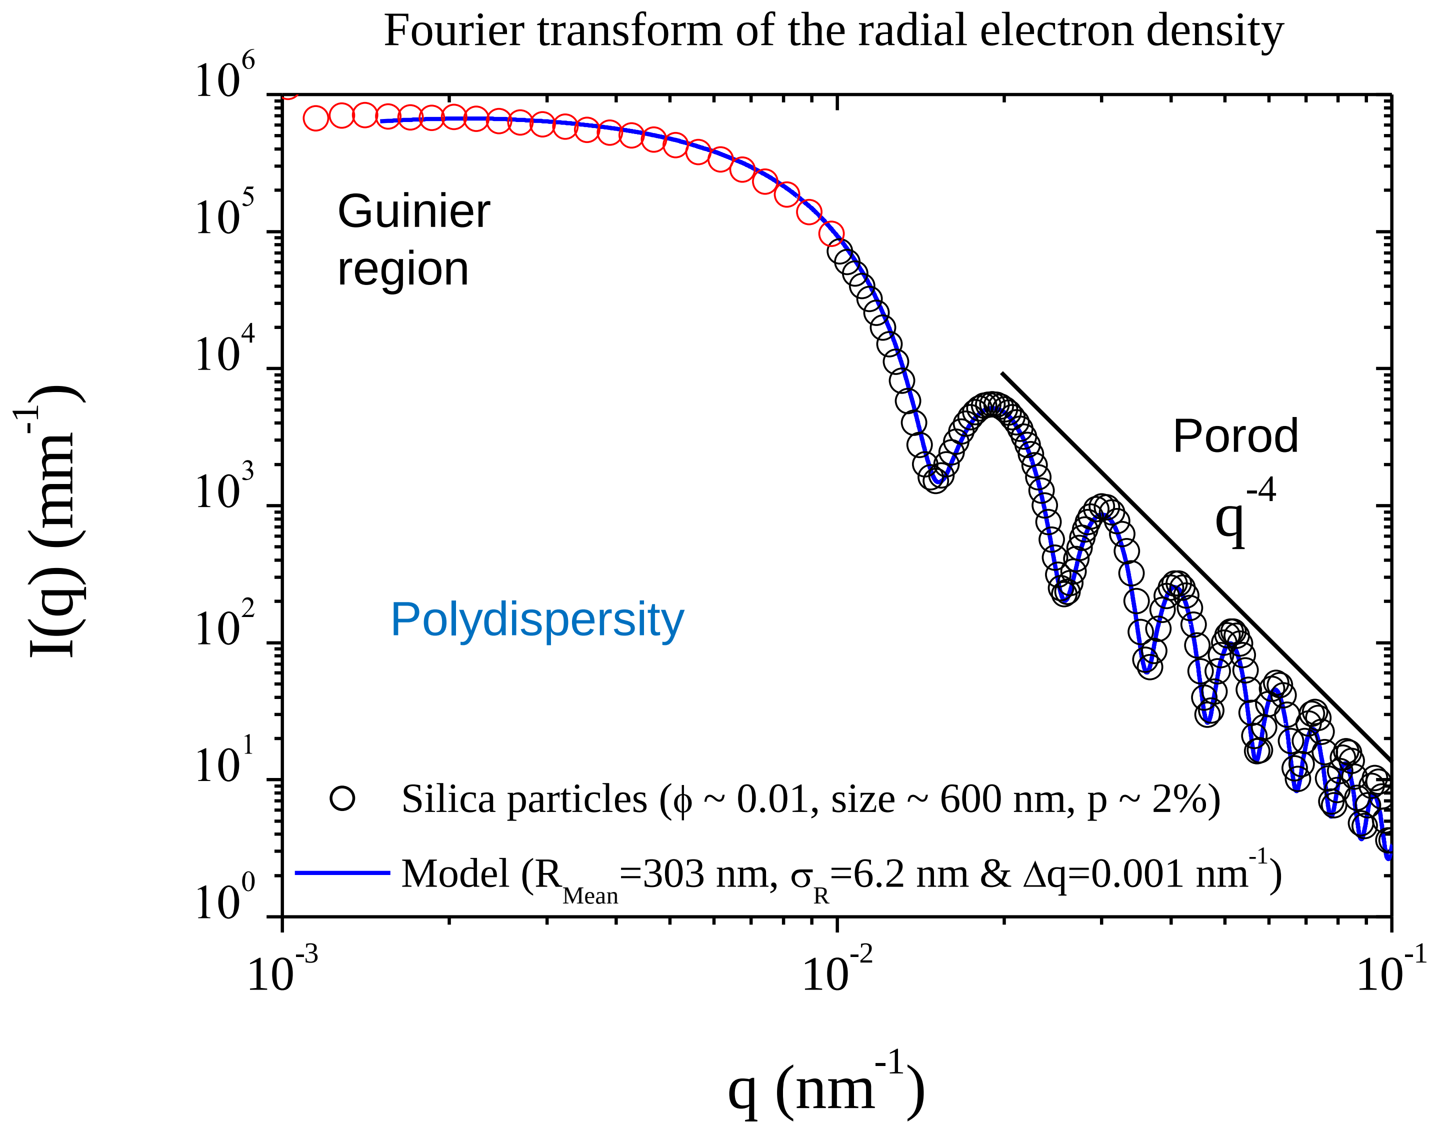


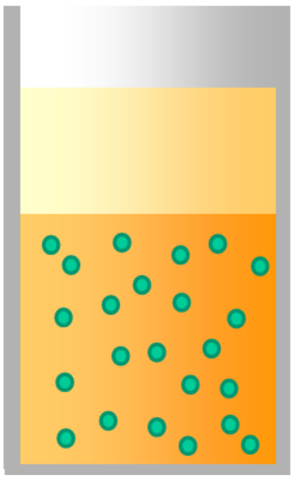
Time resolution: < 100 μs

Size scales probed by SAXS & related techniques



SAXS from dilute spherical particles





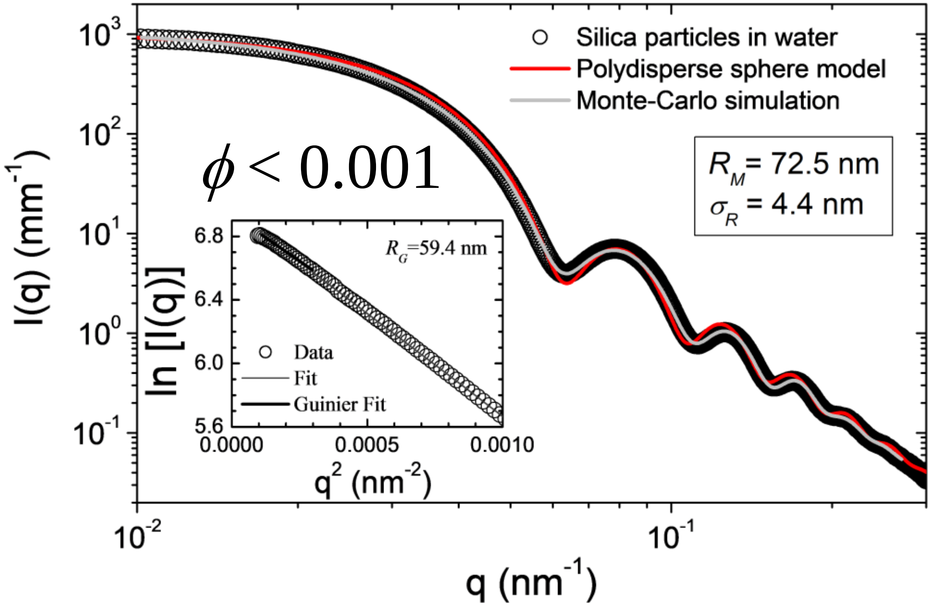
Modeling or simulation required to extract quantitative information

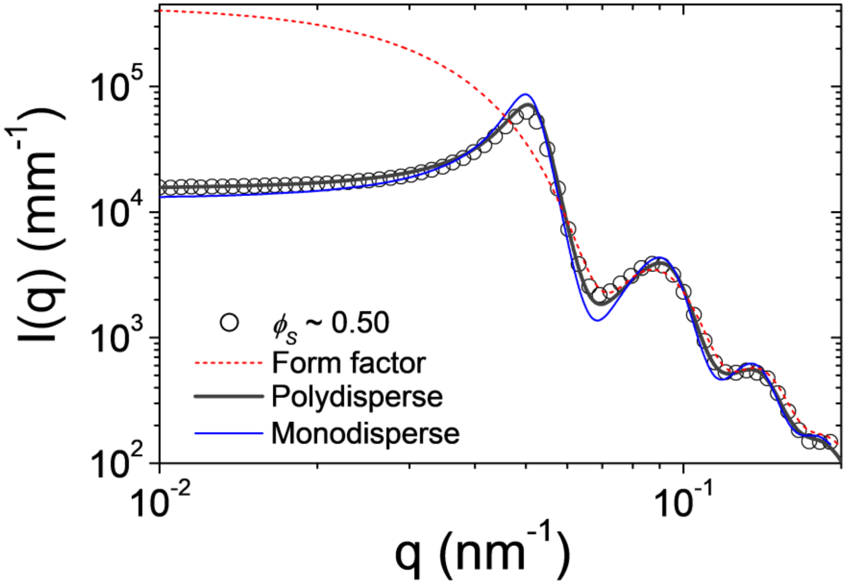
Form & Structure Factors

Differential scattering cross-section per unit volume

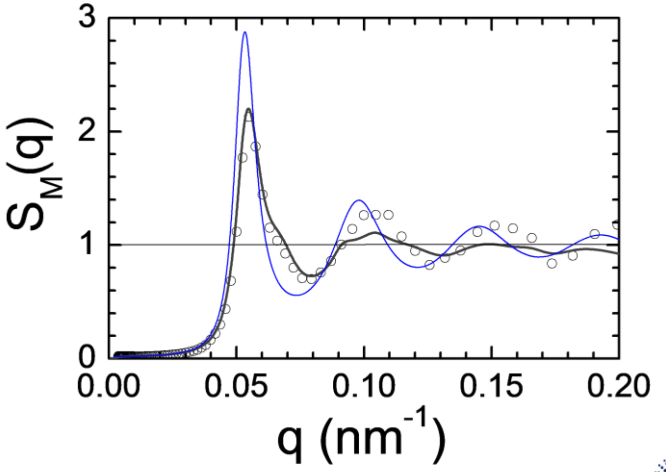
$$I(q) = N(\Delta\rho^* V)^2 P(q)\ S_M(q)$$

FT of radial electron density





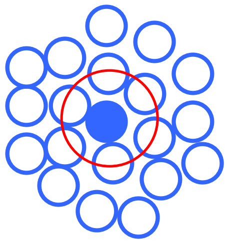
pair correlation function

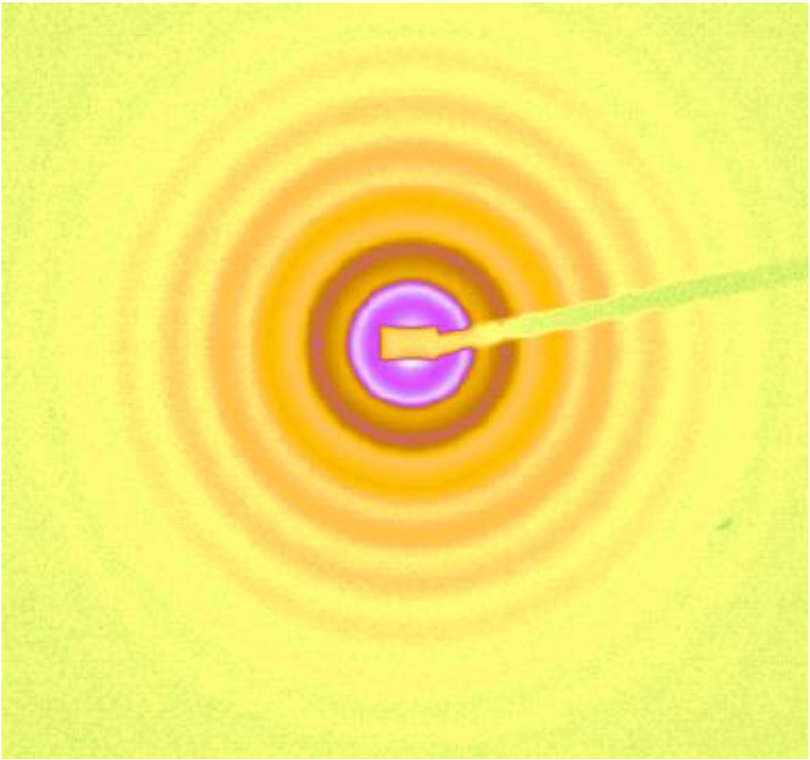


S (q) from liquid state theories (e.g. Percus-Yevick (PY)) or simulations

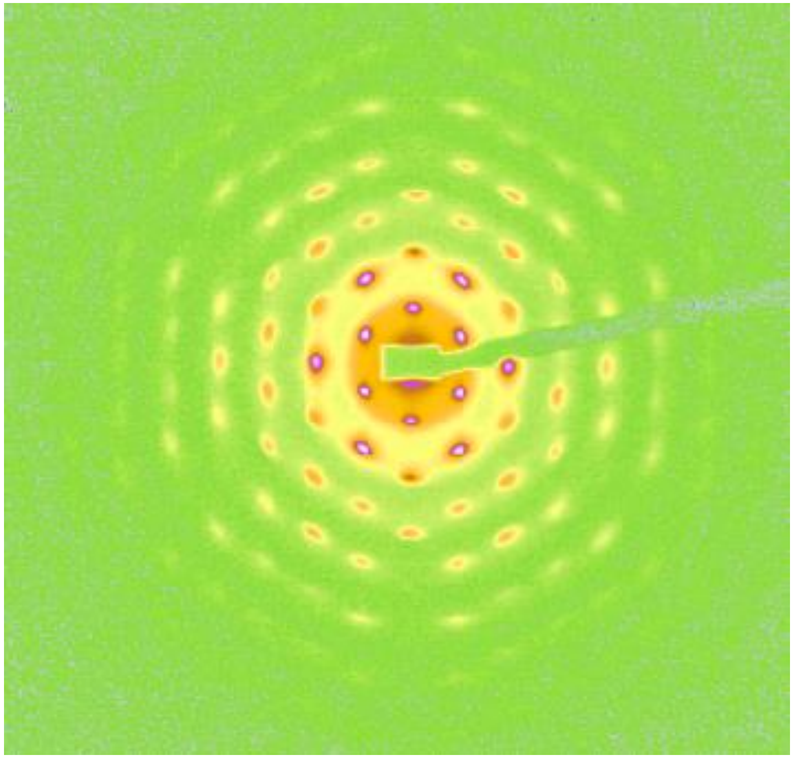
Structure Factors at high packing fractions

E.g. 60%





Glass

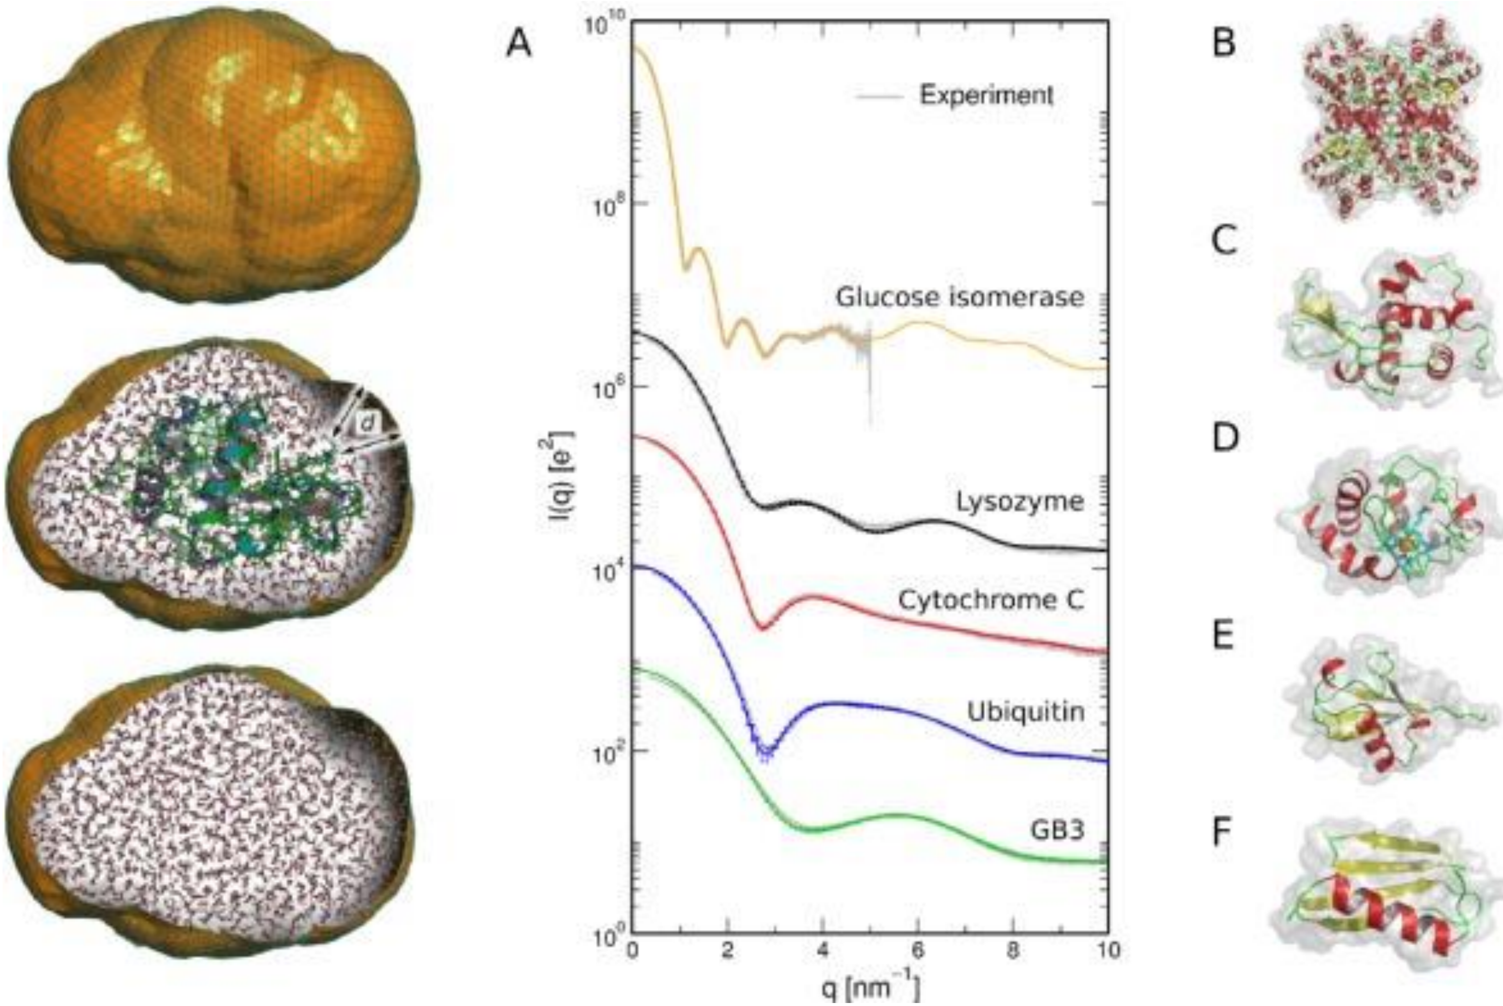


Crystal

Protein Solution Scattering

Traditionally a few structural features: size, shape, size or density distribution

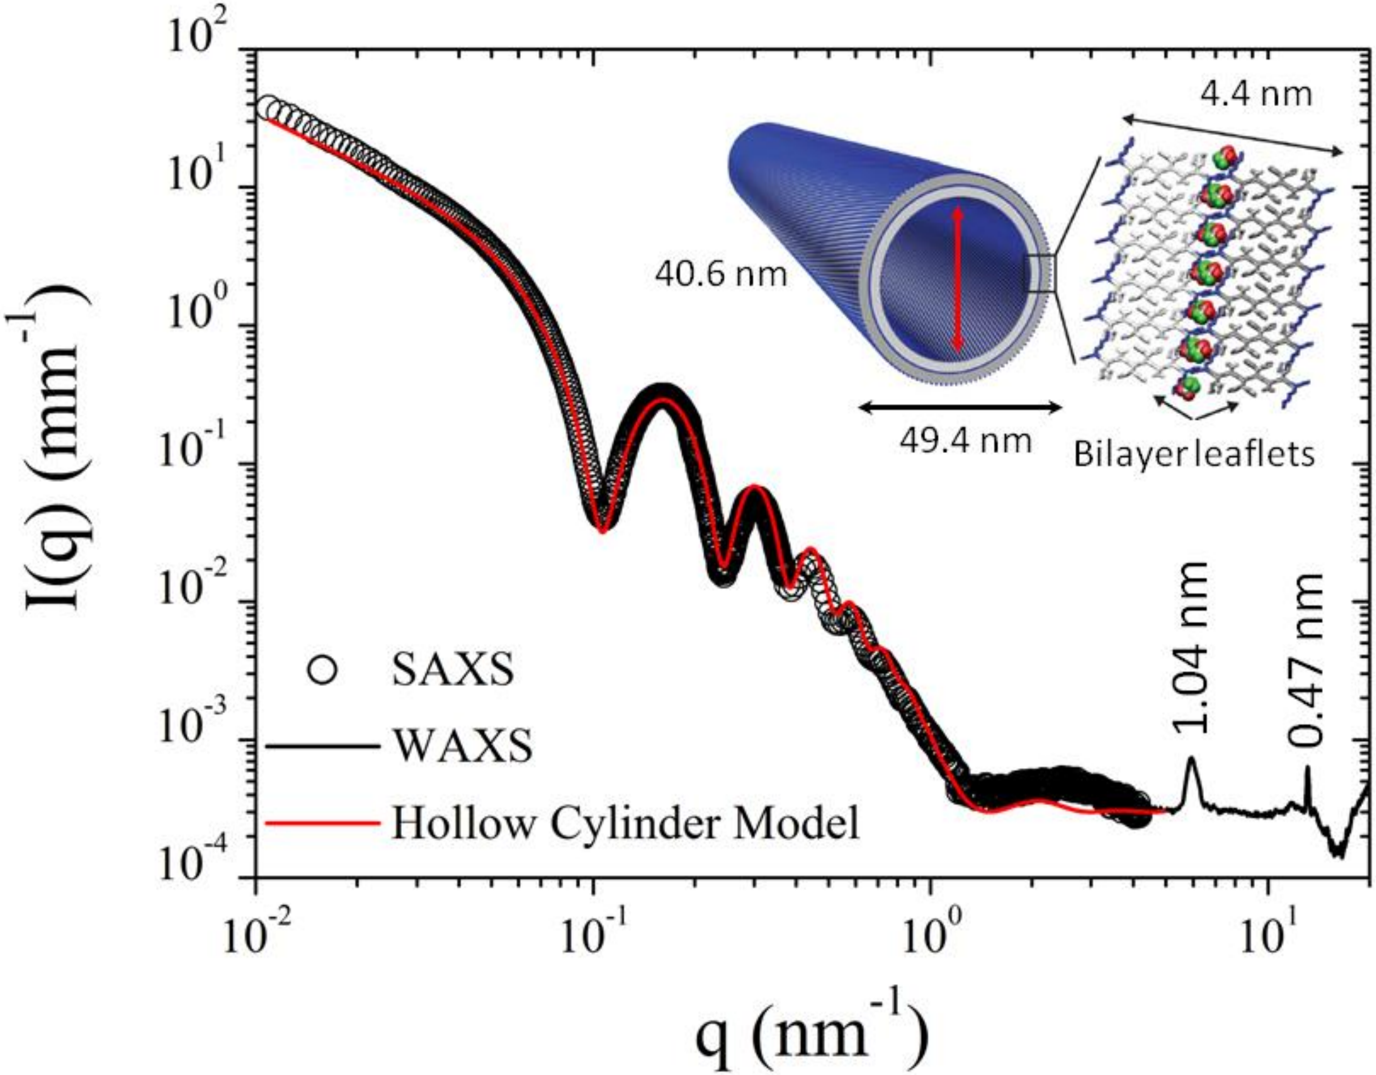
Beamline - BM29



J. Hub - Universität Göttingen

Hierarchical Structures

Self-assembled nanotubes formed by an amyloid β peptide

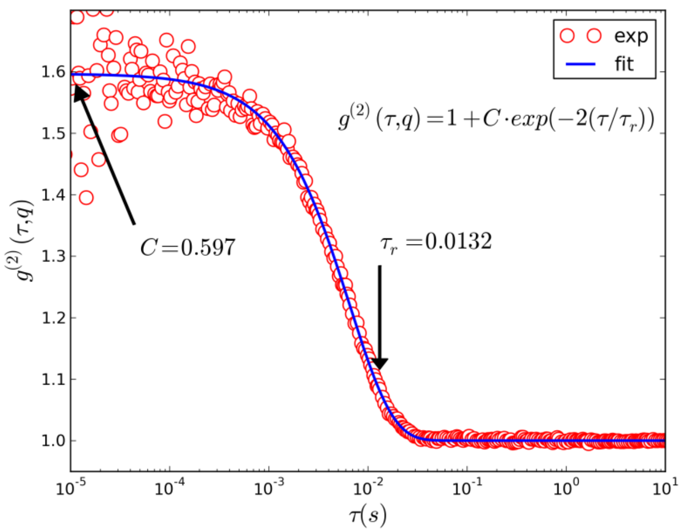


X-ray Photon Correlation Spectroscopy (XPCS)

Coherent beam

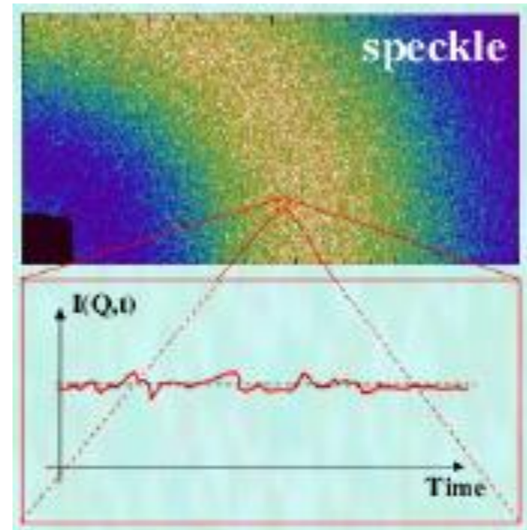
Beamline – ID10

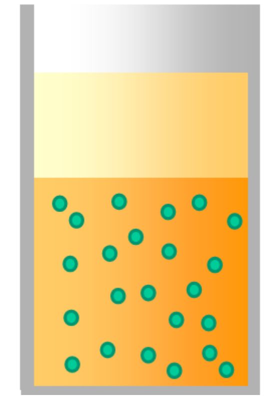
$$g^{(2)}(\tau) = \frac{\langle I(t) I(t+\tau)\rangle}{\langle I(t)\rangle^2}$$



Silica microspheres in water
d=0.49±0.02μm, q=0.09 nm^{-1}

$$1/\tau_r = D_0\, q^2$$





$$\langle \Delta r^2(\tau)\rangle = 6 D_0 \tau$$

mean-square displacement

$$D_0 = \frac{k_B T}{6\pi\eta R}$$

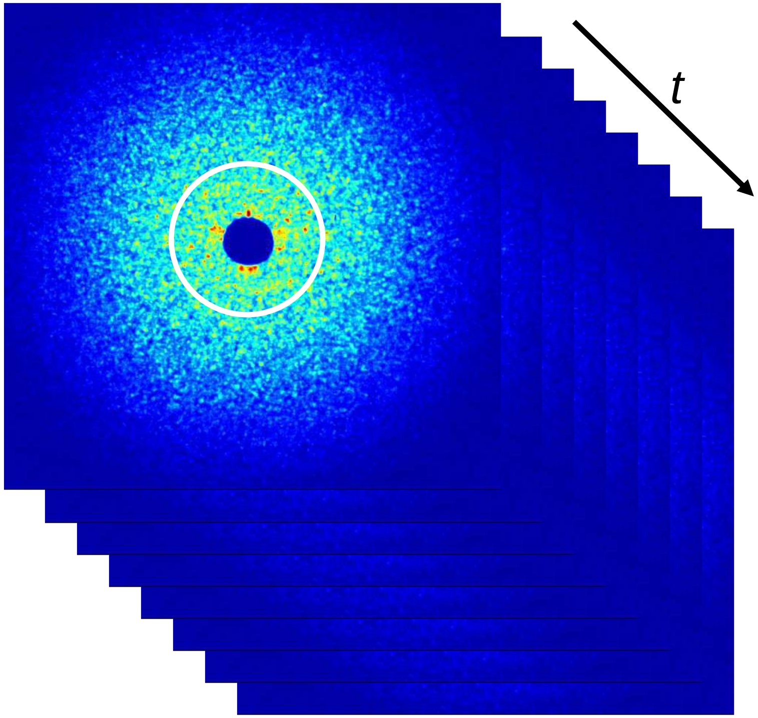
diffusion constant
(Stokes-Einstein)

Multi-Speckle XPCS

Multi speckle XPCS at small and wide angles: ID10 beamline (Y. Chushkin)

At ultra low angles, $10^{-3} \leq q \leq 10^{-1}$ nm^{-1} : ID02 beamline

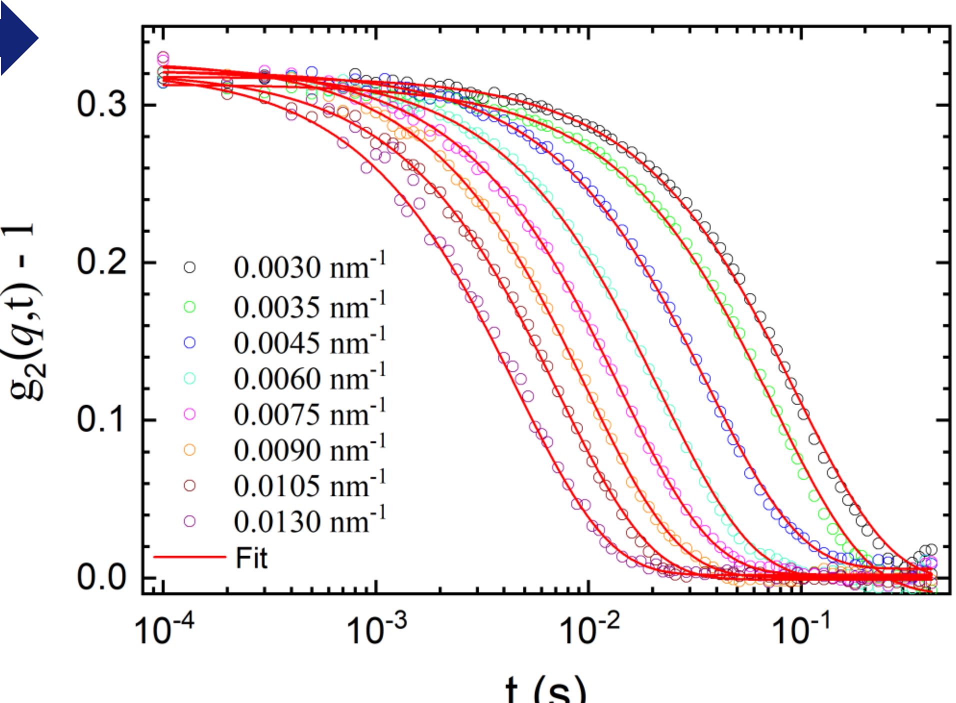
Suitable for optically opaque systems



Dilute silica colloids of 430 nm in size

Intensity autocorrelation function

$$g_2(\boldsymbol{q}, t) = \frac{\langle I(\boldsymbol{q}, \tau) I(\boldsymbol{q}, \tau + t) \rangle}{\langle I(q) \rangle^2}$$

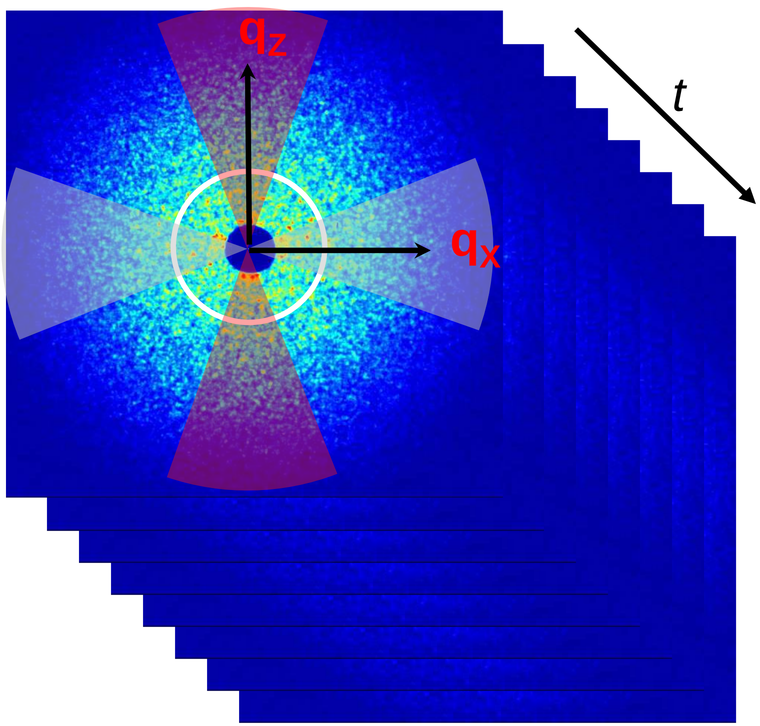


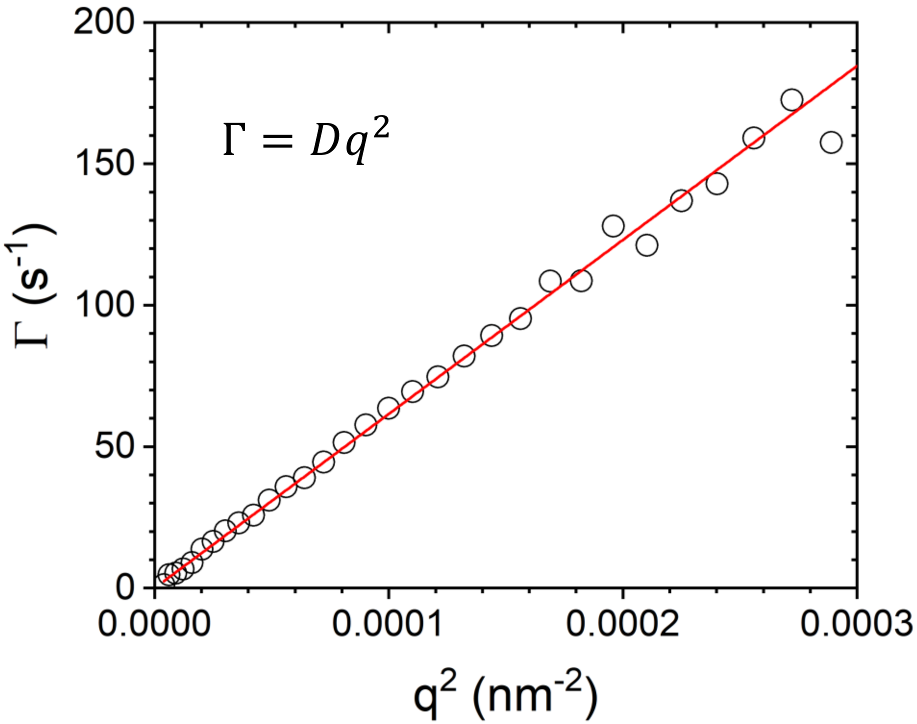
Multi-Speckle XPCS

Multi speckle XPCS at small and wide angles: ID10 beamline (Y. Chushkin)

At ultra low angles, $10^{-3} \leq q \leq 10^{-1}$ nm^{-1} : ID02 beamline

Suitable for optically opaque systems





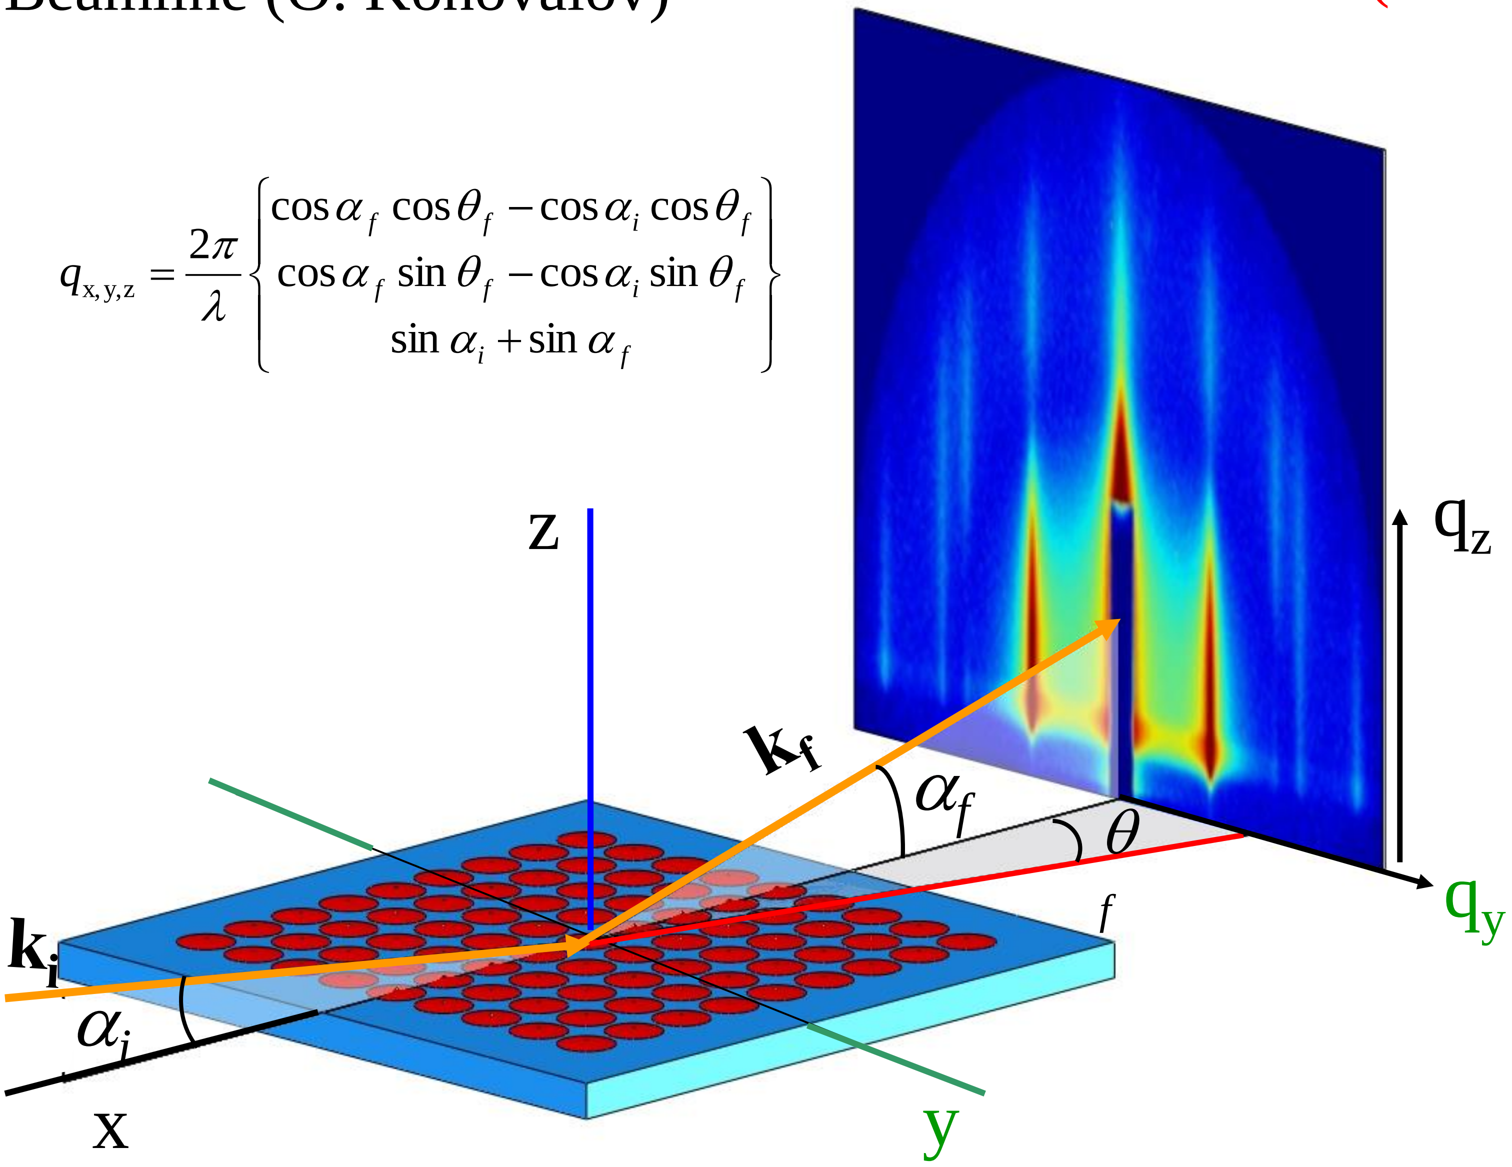
Dilute silica colloids of 430 nm in size

Grazing Incidence Small-Angle X-ray Scattering

ID10 Beamline (O. Konovalov)

(GISAXS)

$$q_{x,y,z} = \frac{2\pi}{\lambda}\begin{Bmatrix} \cos\alpha_f \cos\theta_f - \cos\alpha_i \cos\theta_f \\ \cos\alpha_f \sin\theta_f - \cos\alpha_i \sin\theta_f \\ \sin\alpha_i + \sin\alpha_f \end{Bmatrix}$$



ID10 Surface & Interface Scattering Beamline

GISAXS, GID, XRR, GIXF

(O. Konovalov)

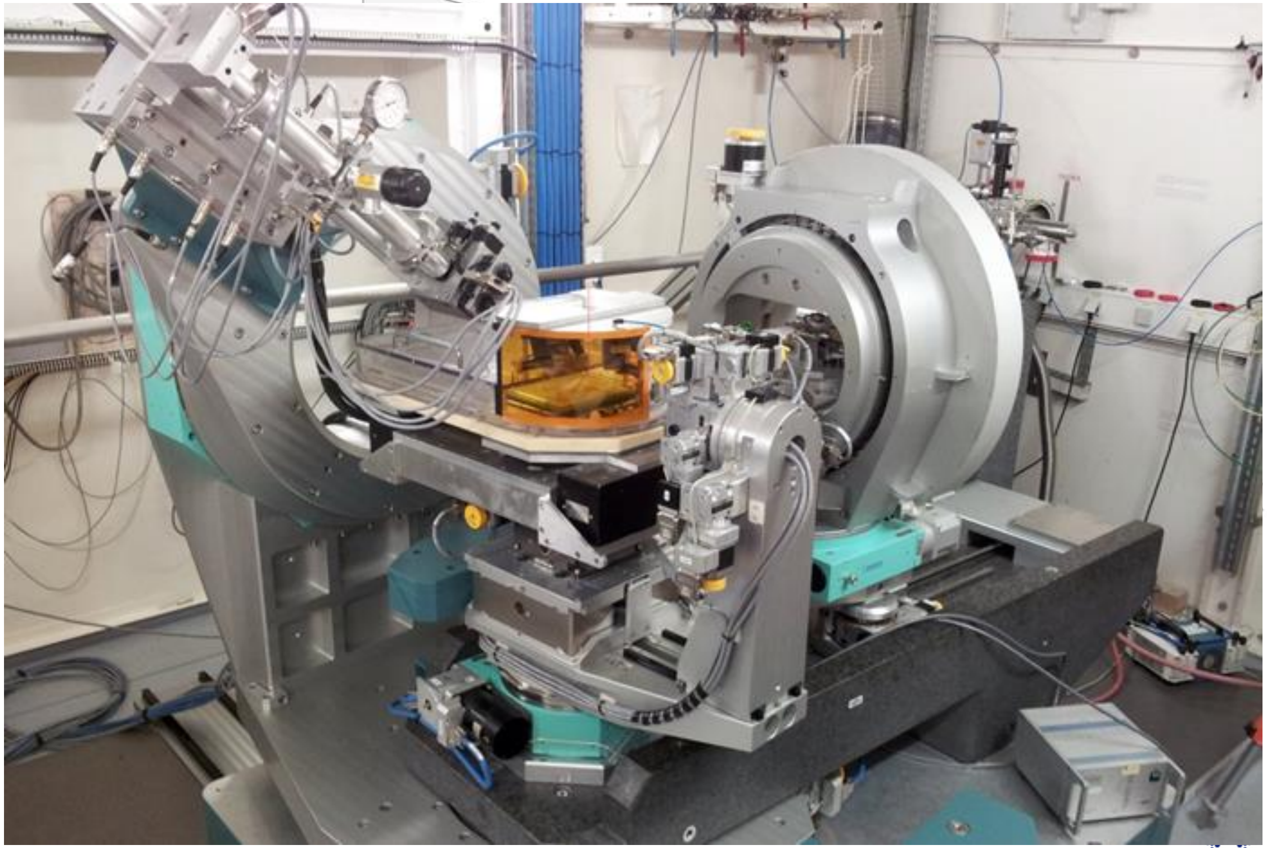
Multipurpose instrument for surface/interface studies

4 circle diffractometer

Beam deflector stage for liquid surfaces

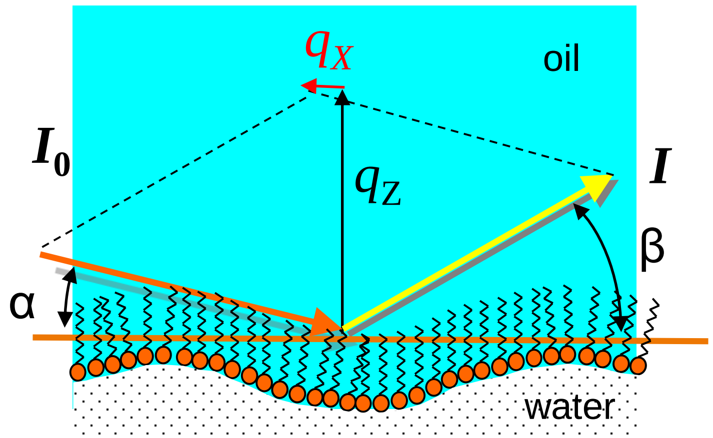
The two-crystal deflector stage rotates the X-ray beam around a fixed point on the liquid surface

$$\left\{ \begin{array}{l} q_X \\ q_Y \\ q_Z \end{array} \right.$$

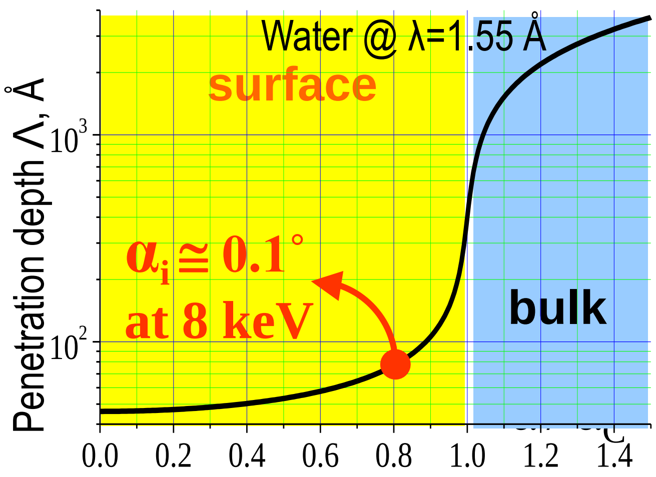


Soft Interfaces Scattering

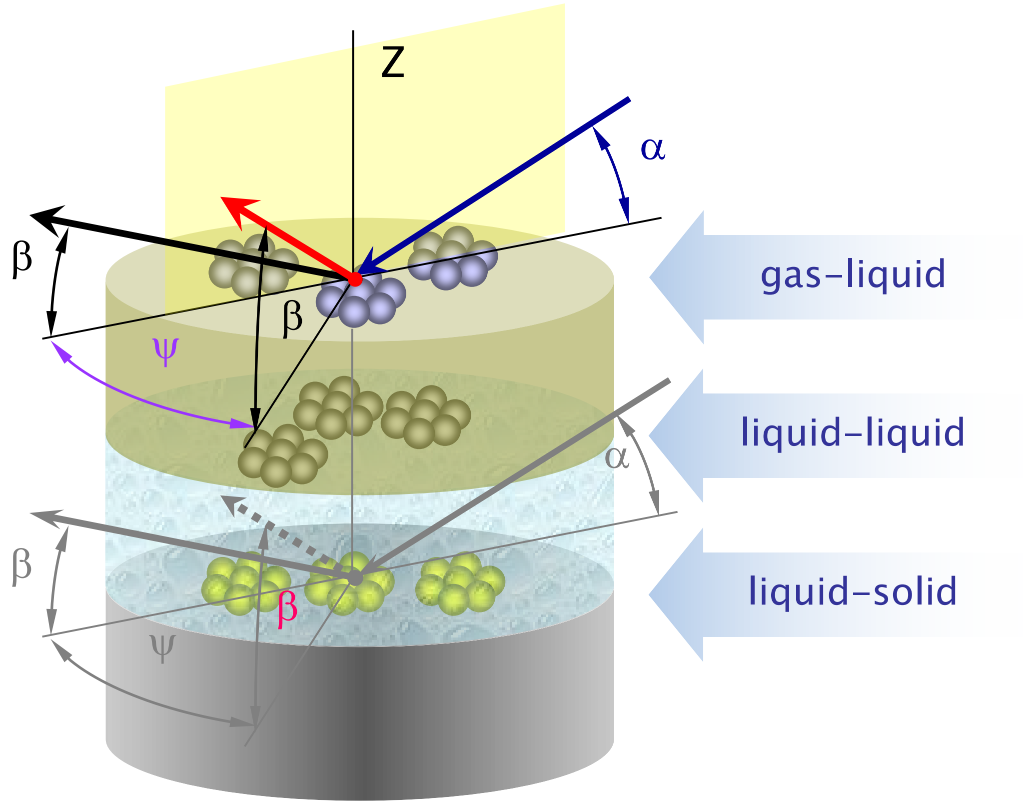
Beamline ID10



Varying the penetration depth

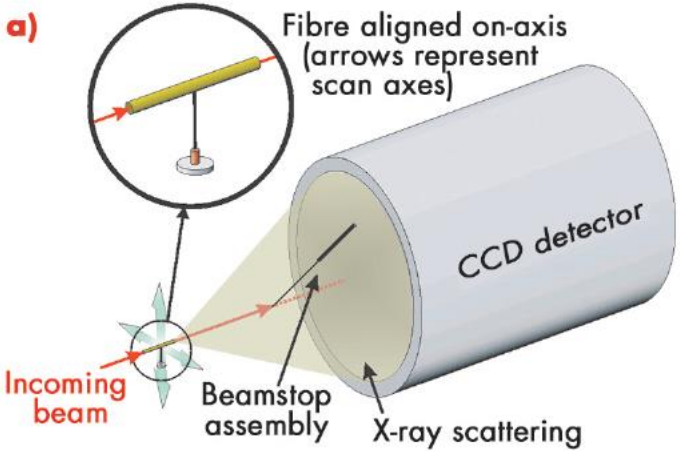


Using higher energy X-rays (> 30 keV)



Scanning Micro-diffraction

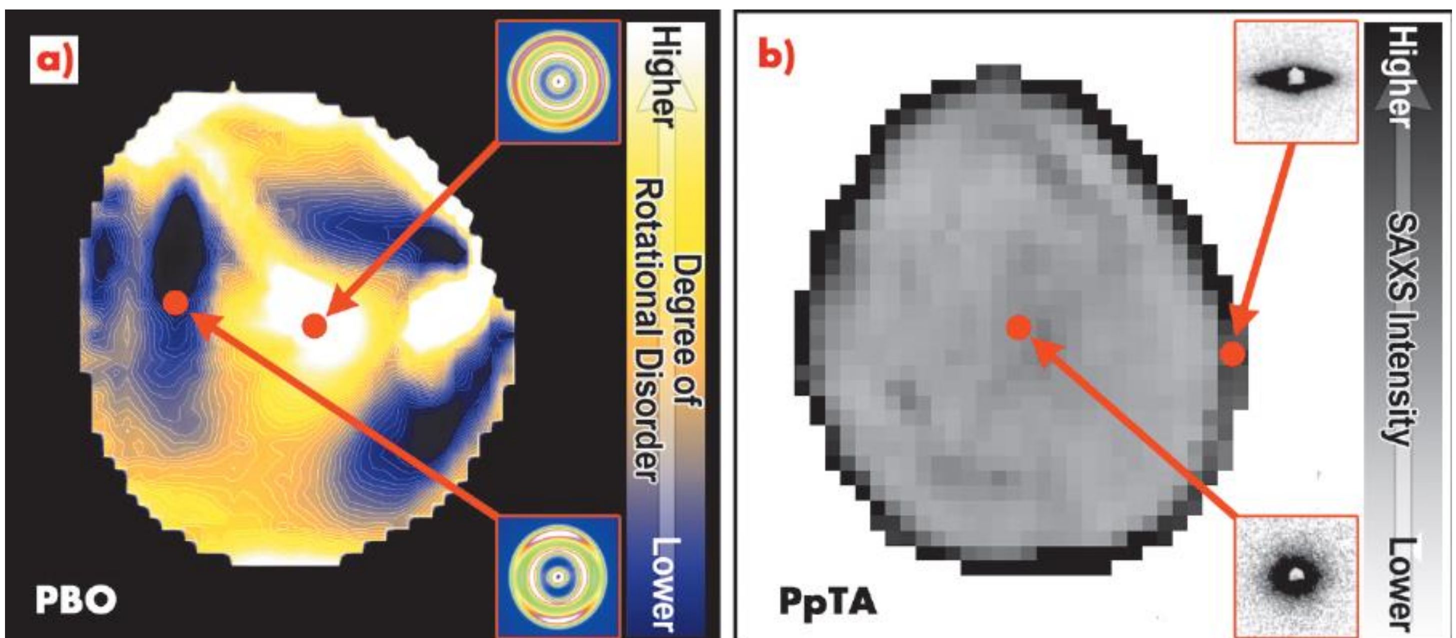
Beamline (ID13)



Combining the real space resolution provided by the beam and reciprocal space information from diffraction/scattering

Correlate the local nanostructure to the fiber mechanical properties.

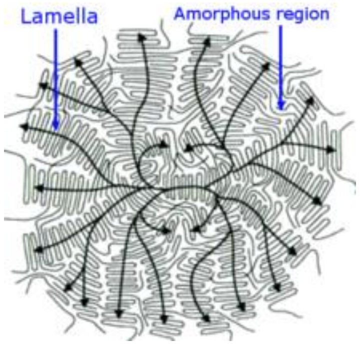
Elucidating the local nanostructure

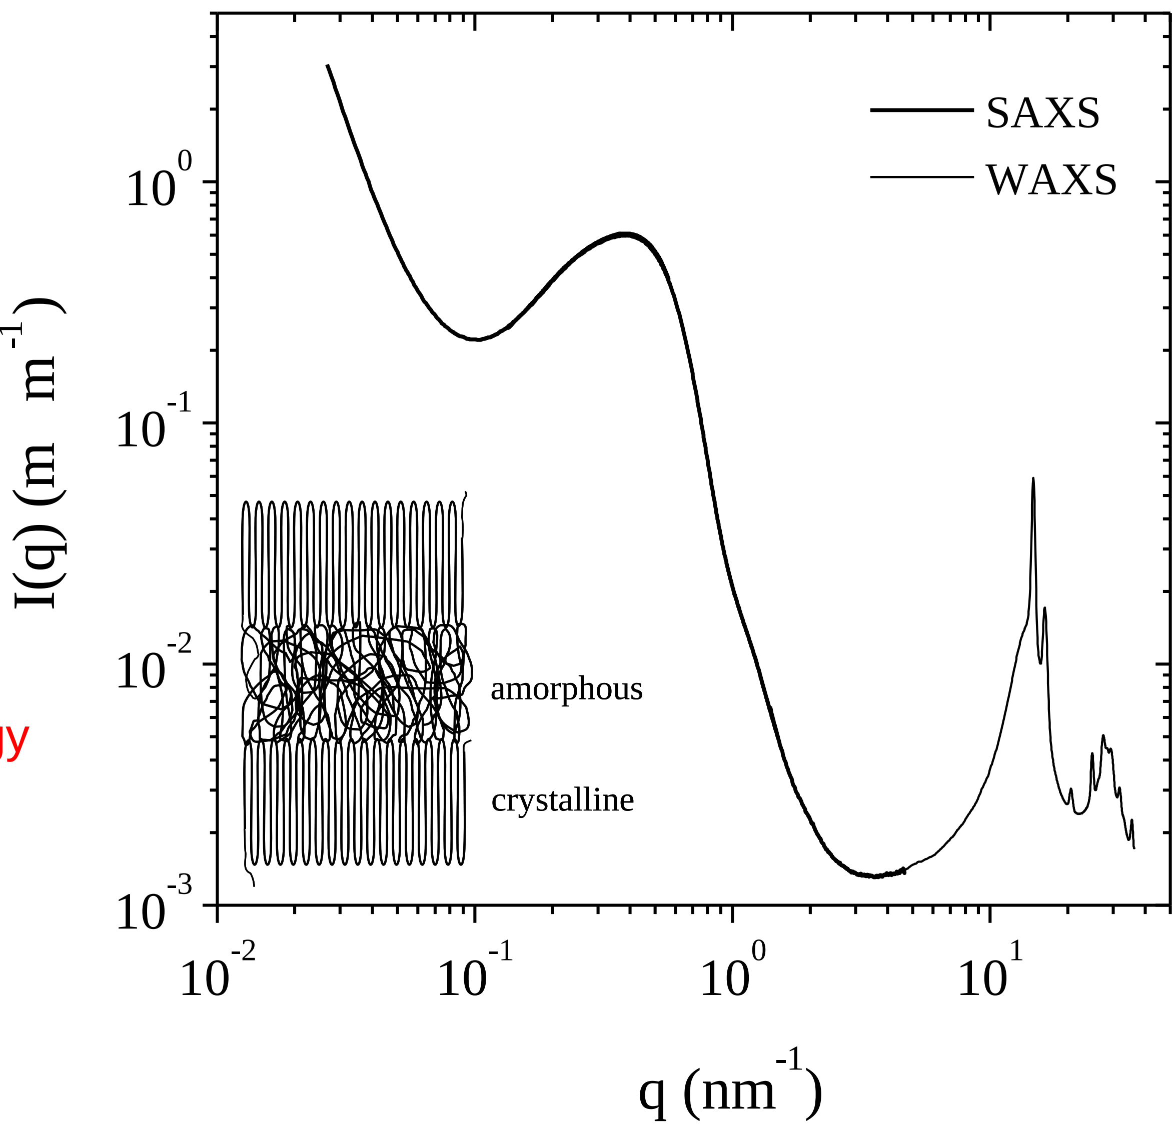


R. Davies *et al.*, *APL (2008)*

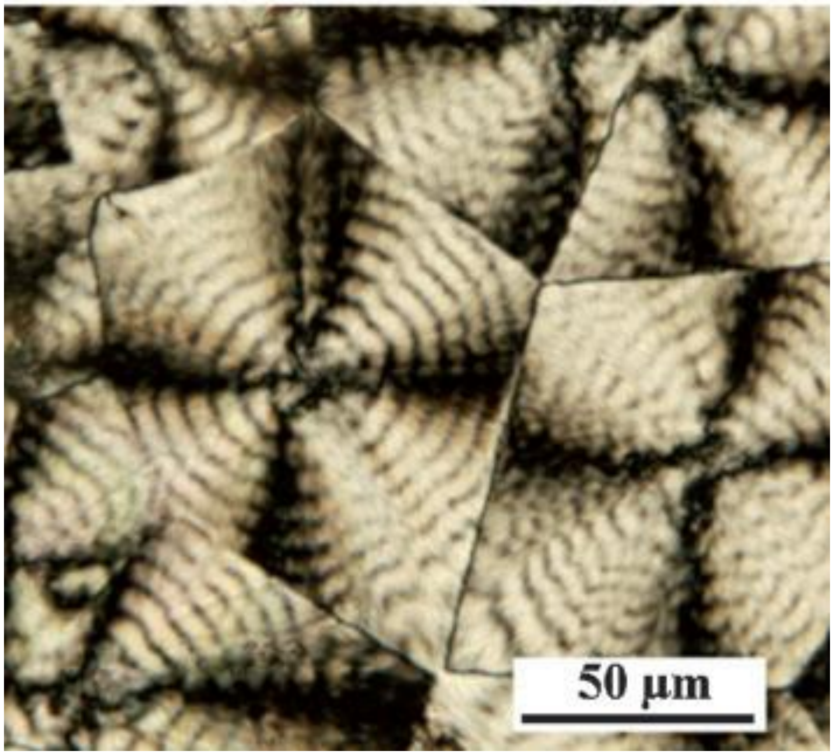
SAXS/WAXS from Semi-crystalline Polymers

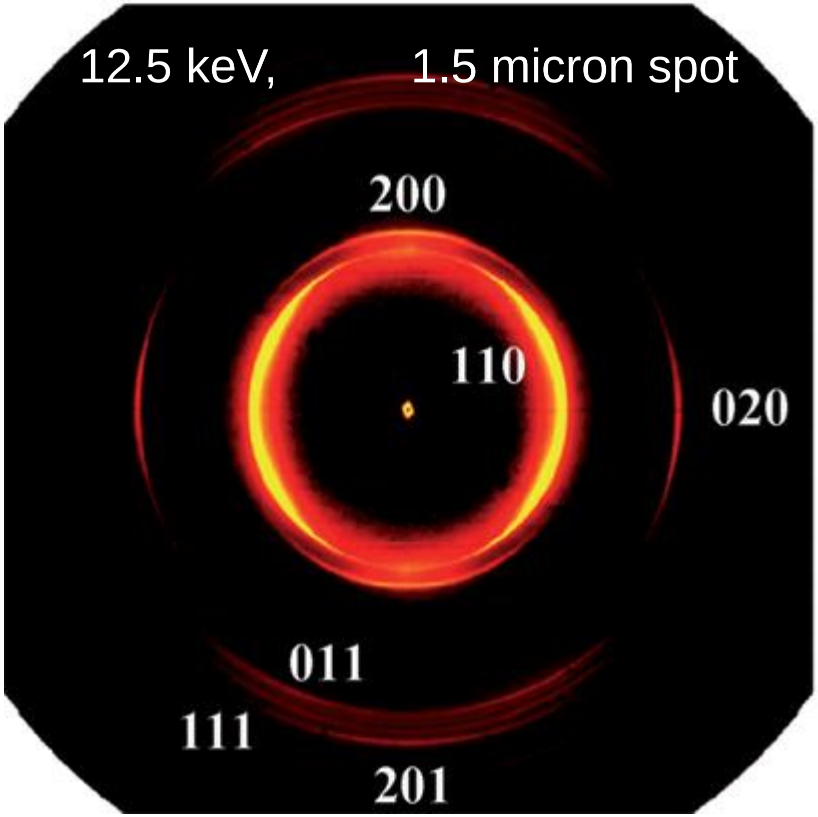
Spherulite morphology





Scanning Micro-diffraction on HDPE spherulites





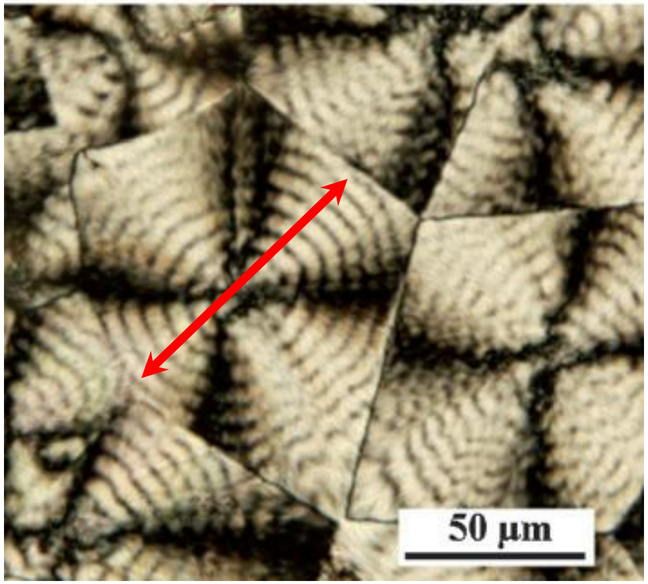
- **high density poly-ethylene**
- spherulites under polarized light banded structures indicating long range order

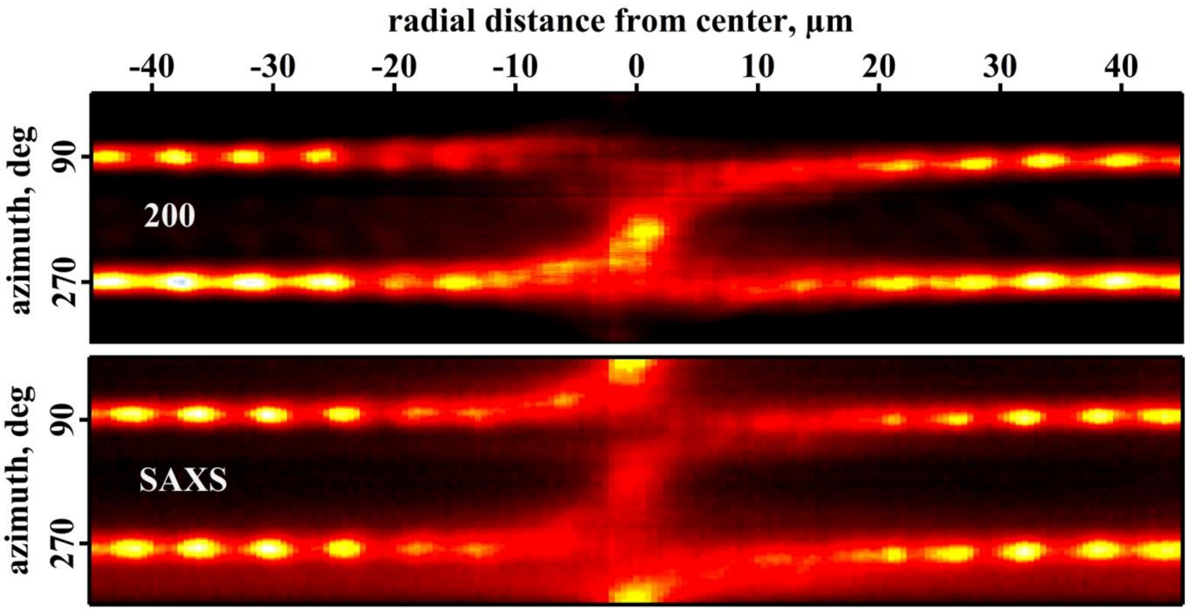
- **SAXS/WAXS** patterns
- line scans across the center reveal information on crystallite orientation

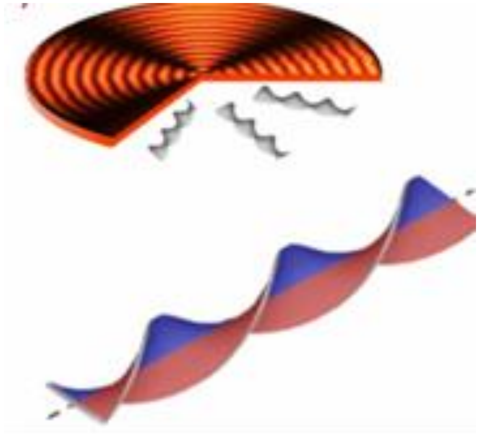
*M. Rosenthal et al., Angewandte Chemie, **123**, 9043-9047 (2011)*

Chirality of twisted polymer crystals

Azimuth/Intensity vs Distance from the center in μm







- 35° tilt between c-axis and the normal of the base plane of crystalline lamellas
- orientation of b-axis aligned with growth direction
- chirality can be determined

*M. Rosenthal et al., Angewandte Chemie, **123**, 9043-9047 (2011)*

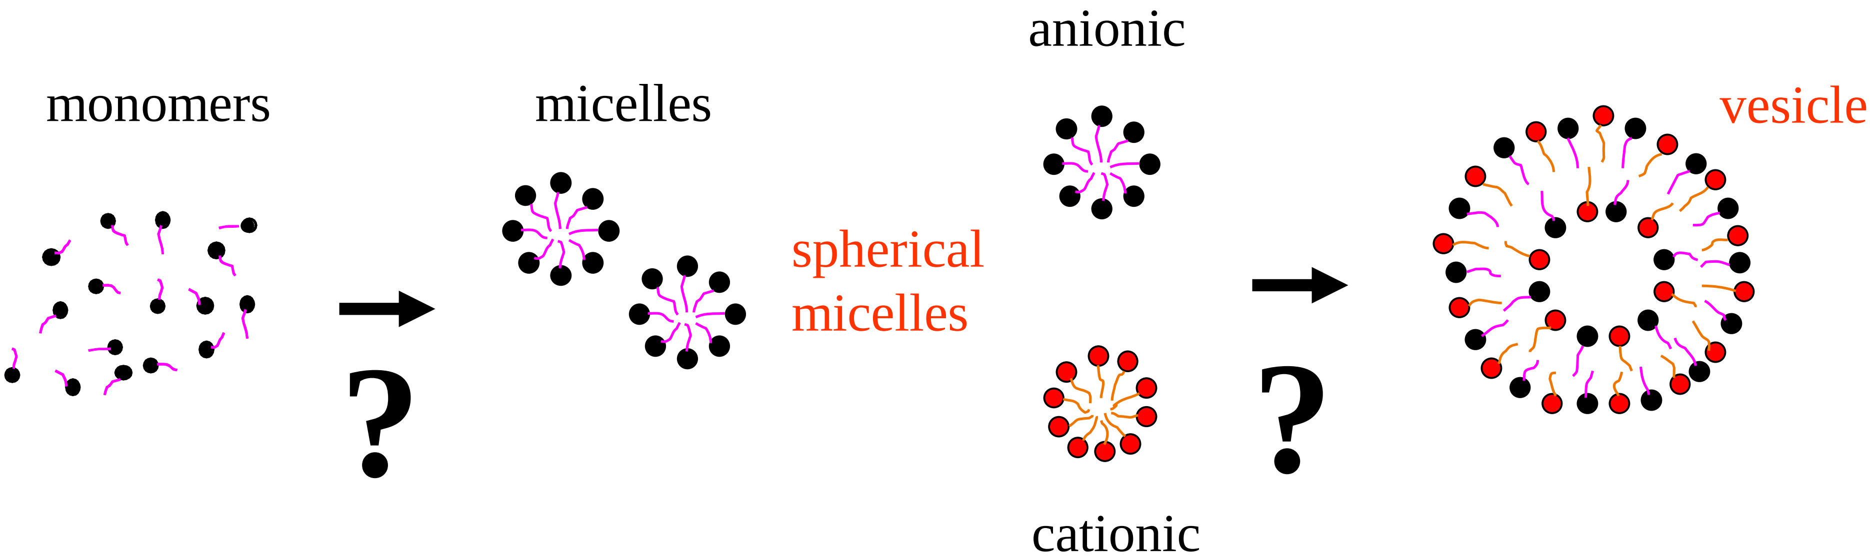
Soft Matter Self-Assembly

Spontaneous self-assembly of micelles and vesicles

E.g. surfactants, lipids or block copolymers

Large variety of equilibrium structures
Dynamics of formation is very little explored

Self-assembly of micelles and vesicles



Rate-limiting steps » predictive capability

Kinetic pathway: stopped-flow rapid mixing & time-resolved SAXS

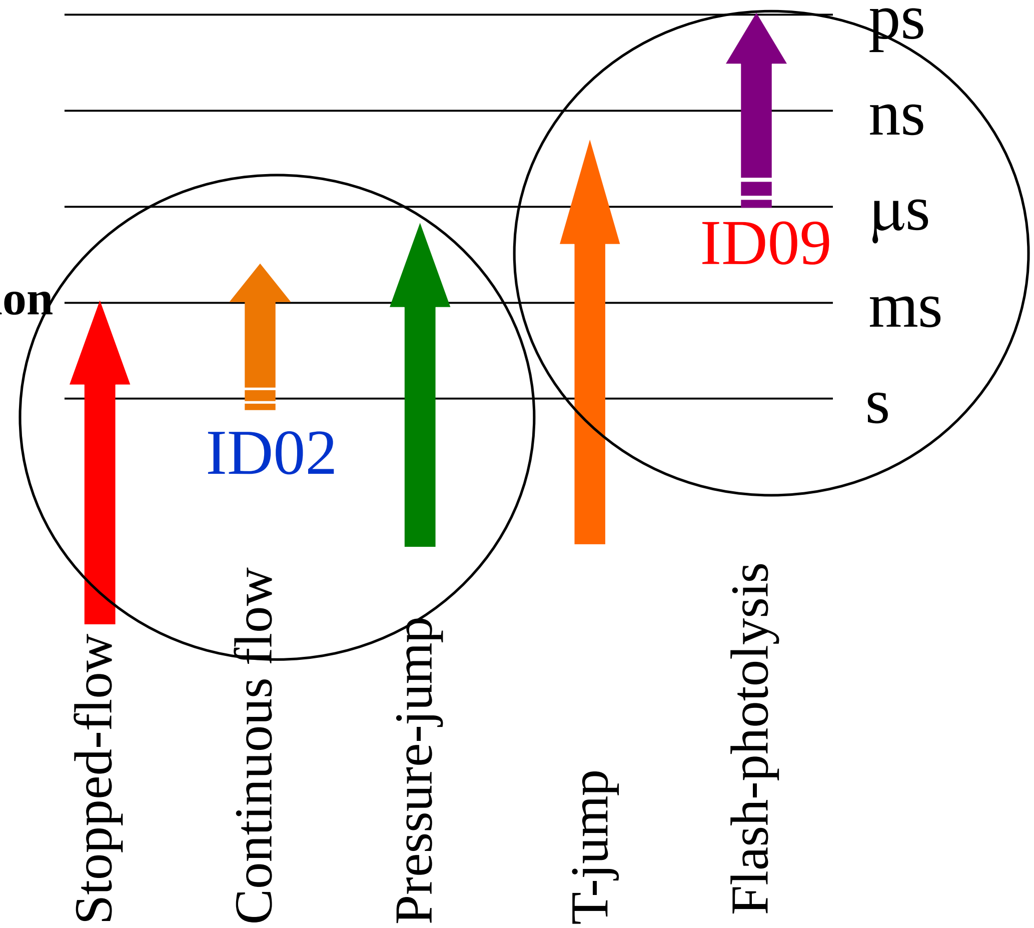
Triggering & Synchronization of Dynamic Processes

E.g. concentration/pH jump (rapid mixing)

Rapid temperature or pressure change

Flash photolysis

ms – folding/self-assembly/nucleation



In water-like solvents

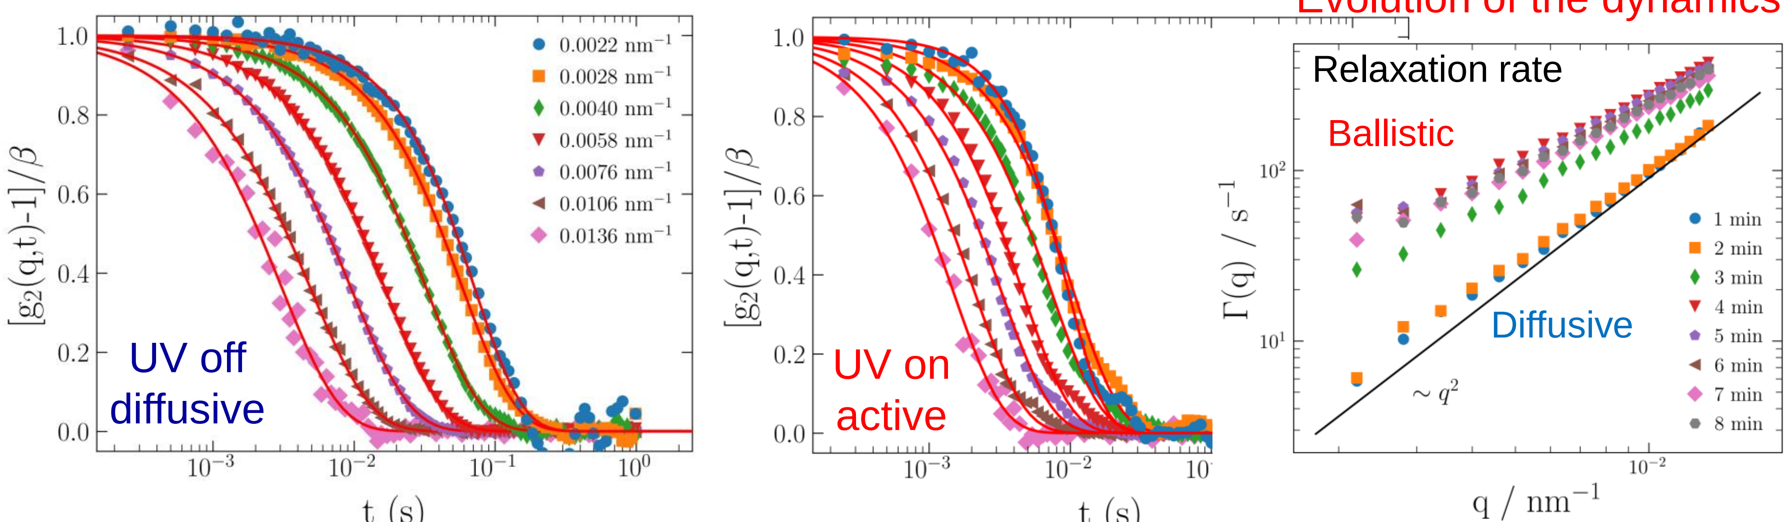
Evolution of the dynamics



Summary & Outlook

• High brilliance X-ray scattering is a powerful method to elucidate the non-equilibrium structure & dynamics of soft matter.

• Time-resolved scattering experiments in the sub-millisecond range can be performed even with dilute samples.

• Combination of nanoscale spatial and millisecond time resolution makes synchrotron techniques unique in these studies.

• Experiments can be performed in the functional state of the system.

• Challenges lie in the ability to investigate multicomponent systems and radiation sensitive specimen.

• The emphasis has become on quantitative studies of highly complex systems by exploiting the coherence properties of extremely bright synchrotron sources. In particular to problems related to the Physics of Life.
